### 1 STABILITY

### 2 ROUTH HURWITZ CRITERION

### 3 BODE PLOTS

3.1. Plot the Bode magnitude and phase plots for the following system

$$G(s) = \frac{50(s+3)(s+5)}{s(s+2)(s+4)(s+6)} \quad (3.1.1)$$

**Solution:** The magnitude and phase plot are as follows: Fig3.1

The python code to obtain the graphs and results:

codes/ee18btech11031.py

3.2. Gain and Phase of Transfer Function

$$G(j\omega) = \frac{50(j\omega+3)(j\omega+5)}{j\omega(j\omega+2)(j\omega+4)(j\omega+6)} \quad (3.2.1)$$

Gain:

$$\frac{100 \sqrt{(\omega)^2 + 9} \sqrt{(\omega)^2 + 25}}{\omega \sqrt{(\omega)^2 + 4} \sqrt{(\omega)^2 + 16} \sqrt{(\omega)^2 + 36}} \quad (3.2.2)$$

Fig. 3.1: Graphs

Phase:

$$\begin{aligned} & \tan^{-1}(0) + \tan^{-1}\left(\frac{\omega}{3}\right) + \tan^{-1}\left(\frac{\omega}{5}\right) - \tan^{-1}\left(\frac{\omega}{2}\right) \\ & - \tan^{-1}\left(\frac{\omega}{4}\right) - \tan^{-1}\left(\frac{\omega}{6}\right) \end{aligned} \quad (3.2.3)$$

3.3. Find the Phase Margin(PM) and verify using the same code

$$PM = \angle G(j\omega_{gc}) + 180^\circ \quad (3.3.1)$$

$$\omega_{gc} = \text{Gain Crossover Frequency} \quad (3.3.2)$$

$$\text{At } \omega_{gc} |G(s)| = 1 \quad (3.3.3)$$

**Solution:**

$$\frac{100 \sqrt{(\omega_{gc})^2 + 9} \sqrt{(\omega_{gc})^2 + 25}}{\omega_{gc} \sqrt{(\omega_{gc})^2 + 4} \sqrt{(\omega_{gc})^2 + 16} \sqrt{(\omega_{gc})^2 + 36}} = 1 \quad (3.3.4)$$

Solving Eq. (3.3.4) or from Fig 3.1 :

$$\Rightarrow \omega_{gc} = 6.438 \quad (3.3.5)$$

$$\angle G(j\omega_{gc}) = -150.725 \quad (3.3.6)$$

$$\Rightarrow PM = 29.275 \quad (3.3.7)$$

3.4. Find the Gain Margin ( $GM$ ) and verify using the same code.

$$GM = 0 - G(j\omega_{pc})db \quad (3.4.1)$$

$$\omega_{pc} = \text{Phase Crossover Frequency} \quad (3.4.2)$$

$$\text{At } \omega_{pc}, \angle G(s) = -180^\circ \quad (3.4.3)$$

**Solution:** From Fig 3.1 ,we can say that phase never crosses  $-180^\circ$  . So , the gain margin is *infinite* and from the equation: 3.4.3,  $\omega_{pc}$  is non-existent.
